

Text Processing, Redirection and Pipes

Text parsing in Linux

- Text is the standard interface in Linux
- This naturally seems inconvenient for us now that we are used to more intuitive interfaces involving graphics and touch
- However, text interface is extremely powerful, because it allows all Linux commands to easily “interact” with one another in solving complex tasks
- We will see today how this approach can be used to write simple “one-line programs” to solve the following tasks:
 - Print line n to line m of a given file
 - Take a phone directory file and create a count table for number of names that start in each letter of the alphabet
 - Find the ten most common words in a given text file

Lecture overview

- Text processing commands (`head`, `tail`, `wc`) ←
- Redirection
- Pipes
- Text delimited tables (`cut`, `paste`, `sort`)
- Simple character-based editing (`tr`)

Text processing commands

Text provides a simple mechanism for storing data and for passing it between applications and utilities

Text is the main interface of UNIX-based systems

Displaying file contents

- `cat file` – displays the contents of a (text) file
- `more file` – displays the contents of a (text) file up to what can be viewed in one screen – can be scrolled down
- `less file` – similar to `more`, but you can scroll up and down and search (as you do with `man` pages)

Viewing portions of a file – head and tail

- The **head** command shows only the first few lines of a file

```
head [options] [files]
```

- With no options, **head** shows first 10 lines
- Select command line options for **head**:
 - **-nX** – show first **X** lines
 - **-n-X** – show all but last **X** lines
 - **-cX** – show first **X** bytes
 - **-c-X** – show all but last **X** bytes(type **head --help** for all options)

Viewing portions of a file – head and tail

- The **tail** command shows only the **last** few lines of a file

```
tail [options] [files]
```

- With no options, **tail** shows **last** 10 lines
- Select command line options for **tail**:
 - **-nX** – show last **X** lines
 - **-n+X** – show all lines starting from line **X**
 - **-cX** – show last **X** bytes
 - **-c+X** – show all bytes starting from byte **X**
 - **-f** – used to view a log file as it is updated (not discussed this semester)(type **tail --help** for all options)

head and tail – examples

Given a file called '`phone_dir.txt`':

```
ADAMS, Andrew 7583
BARRETT, Bruce 6466
BAYES, Ryan 6585
BECK, Bill 6346
BENNETT, Peter 7456
DAVIS, John 3456
ESSA, Konrad 3549
GRAHAM, Linda 6141
HARMER, Peter 7484
LINCOLN, Abe 9749
MAKORTOFF, Peter 9328
MEASDAY, David 6494
NAKAMURA, Satoshi 6453
REEVE, Shirley 7391
ROSNER, David 6830
```

head and tail – examples

```
head -n3 phone_dir.txt
```

ADAMS, Andrew 7583
BARRETT, Bruce 6466
BAYES, Ryan 6585

```
tail -n3 phone_dir.txt
```

NAKAMURA, Satoshi 6453
REEVE, Shirley 7391
ROSNER, David 6830

```
head -c30 phone_dir.txt
```

ADAMS, Andrew 7583
BARRETT, Br

head and tail – examples

```
tail -n+12 phone_dir.txt
```

MEASDAY, David 6494
NAKAMURA, Satoshi 6453
REEVE, Shirley 7391
ROSNER, David 6830

```
tail -c50 phone_dir.txt
```

toshi 6453
REEVE, Shirley 7391
ROSNER, David 6830

```
tail -c11 phone_dir.txt
```

David 6830

Counting lines/words/bytes (chars) – **wc**

- The **wc** command counts the number of lines, words, and bytes in a file

```
wc [options] [files]
```

- Command line options for **wc**:
 - **-l** – print the number of lines
 - **-w** – print the number of words
 - **-c** – print the number of bytes
- With no options, all three are printed

Lecture overview

- Text processing commands (`head`, `tail`, `wc`)
- **Redirection** ←
- Pipes
- Text delimited tables (`cut`, `paste`, `sort`)
- Simple character-based editing (`tr`)

Input and output redirection

- Normally, when you run a command, it gets input from the keyboard (**stdin**) and sends output to the screen (**stdout** and **stderr**)

- Use '**>**' or '**1>**' to redirect **stdout** (standard output) to file
- Use '**2>**' to redirect **stderr** (standard error) to file
- Use '**&>**' to redirect **stdout** and **stderr** to file together
- Use '**<**' to redirect file into **stdin** (standard input) of command

Input redirection

- We use the '<' operator to redirect the contents of a file into the input of a command
- This is useful for automation of commands that typically require typing the input by the keyboard
- Input redirection with '<' is not very common because most Linux commands do not require input from the keyboard, and for those who do, we can also use pipes (...later today)

Output redirection

- We use the '>' operator to redirect the output of a command
- For example, to create a file containing a listing of files in the current directory – redirect **stdout** via >:

```
ls > files  
cat files
```

```
file1.txt  
file2  
file2.tmp  
file2.txt  
file3.txt
```

Output redirection – stdout and stderr

- Example of standard output and standard error

```
ls *.c *.txt
```

```
ls: cannot access *.c: No such file or directory    ← stderr  
file1.txt  file2.txt  file3.txt                ← stdout
```

- Redirection of standard output (standard error directed to screen)

```
ls *.c *.txt > files    ← redirect stdout
```

```
ls: cannot access *.c: No such file or directory    ← stderr
```

```
cat files
```

```
file1.txt  
file2.txt  
file3.txt
```

Output redirection – stdout and stderr

- Example of standard output and standard error

```
ls *.c *.txt
```

```
ls: cannot access *.c: No such file or directory  
file1.txt file2.txt file3.txt
```

← **stderr**
← **stdout**

- Redirection of standard output + standard error

```
ls *.c *.txt &> files ← redirect stdout + stderr
```

```
cat files
```

```
ls: cannot access *.c: No such file or directory  
file1.txt  
file2.txt  
file3.txt
```

Output redirection – stdout and stderr

- Example of standard output and standard error

```
ls -l *.txt *.tmp 1>out ← redirect stdout
```

```
ls -l *.txt *.tmp >out ← redirect stdout
```

```
ls -l *.txt *.tmp 2>out ← redirect stderr
```

```
ls -l *.txt *.tmp 1>out 2>err ← redirect stdout +  
                                stderr to different files
```

```
ls -l *.txt *.tmp 1>out 2>>err  
                                redirect stdout +  
                                redirect with append stderr  
                                to different files
```

Appending output

- When redirecting output to a file, the specified file is either created (if it does not exist), or overwritten (if it exists)
- The '>>' operator tells the shell to append the output to the file, without overwriting it

Appending output – example

```
echo first line > lines.txt  
echo second line >> lines.txt  
echo third line >> lines.txt  
cat lines.txt
```

```
first line  
second line  
third line
```

```
echo fourth line > lines.txt  
cat lines.txt
```

```
fourth line
```

Lecture overview

- Text processing commands (`head`, `tail`, `wc`)
- Redirection
- Pipes ←
- Text delimited tables (`cut`, `paste`, `sort`)
- Simple character-based editing (`tr`)

Pipes

- The following commands count how many '**.txt**' files are in the current directory

```
ls *.txt > files  
wc -w files
```

- Assuming filenames have no spaces (since in that case, multiple words will be counted for one filename)
- This is not very efficient, and it also leaves behind a temporary file as a side effect
- What we really want is to link the output of **ls** directly to the input of **wc**

Pipes

A *pipe* takes the output of one command, and passes it as input to another

| created with shift + \ →

`ls *.txt`

|

`wc -w`

* when command `wc` reads input from stdin, it only prints the counts (no file names)

Pipes

- The two commands from the previous example can be simply combined:

```
ls *.txt | wc -w
```

- The symbol for a pipe is a vertical bar – '|'
- The format of a command line which uses a pipe is:

```
command1 [args] | command2 [args]
```

Pipes

- The use of *pipes* is actually a simple and easy form of inter-process communication
- Pipes can also be chained, so complex utilities can be created by combining simple building blocks
- When data passes through several pipes, these are sometimes referred to as *filters*

Pipes – examples

Reminder

`head -nN` – show first *N* lines

`head -n-N` – show all but last *N* lines

`tail -nN` – show last *N* lines

`tail -n+N` – show all lines starting from line *N*

- Print lines 3 and 4 of 'phone_dir.txt':

```
head -n4 phone_dir.txt | tail -n2
```

BAYES, Ryan 6585
BECK, Bill 6346

- Another way to get the same results:

```
tail -n+3 phone_dir.txt | head -n2
```

- To find the most recently changed file:

```
ls -t | head -n1
```

↑
Sorts file in

of update time

Lecture overview

- Text processing commands (`head`, `tail`, `wc`)
- Redirection
- Pipes
- Text delimited tables (`cut`, `paste`, `sort`) ←
- Simple character-based editing (`tr`)

Homework Insights for Writing Solutions

- Use **relative paths** unless otherwise instructed
- There is not just one possible solution. Even so, make sure to use only commands/flags learned in lectures/recitation or given for self-study.
 - **Don't use commands/flags/methods we didn't learn**
- You can use any editor, even one that is not on the server
 - But make sure that the solution works on the server
 - Especially when moving from different OS and hidden characters emerge
- Good practice to start by copying all material to directory exercises/ex<NUM> (as specifically instructed on HW ex1)
 - After copying: if there are problems with permissions, then check if you have permissions to the dir/file

Homework Insights on Submissions

- Standard submission:
 - `check_ex ex<NUM>`
 - Will prompt for errors in submission (number of lines/commands, missing PARTNER file, etc.)
 - Content of PARTNER file: server username (if submitting alone) or server username of partner (otherwise) – note: username and not teudat zehut
 - `submit_ex ex<NUM>`
- Late submission:
 - Submit a request no later than 48 hours before deadline
 - Infrequently approved (with no penalty)
 - If due to miluim – go through Students' Administration beforehand
 - Let us know once submission is ready to be checked

Text delimited tables

- Each line is considered as a series of **fields** separated by **delimiter** characters
- The delimiter is set by default to "`\t`" (<tab>), but it can be defined as any other character, such as " ", "`_`", and "`:`"
- You can **cut**, **paste**, and **sort** text delimited tables

Text delimited tables – examples

`phone_dir.txt:`

```
ADAMS, Andrew 7583  
BARRETT, Bruce 6466  
BAYES, Ryan 6585  
BECK, Bill 6346  
BENNETT, Peter 7456  
DAVIS, John 3456  
ESSA, Konrad 3549  
GRAHAM, Linda 6141  
HARMER, Peter 7484  
LINCOLN, Abe 9749  
MAKORTOFF, Peter 9328  
MEASDAY, David 6494  
NAKAMURA, Satoshi 6453  
REEVE, Shirley 7391  
ROSNER, David 6830
```

Cutting

The command **cut**: prints a subset of chars/fields of every line in a file

Usage: **cut** [options] [files]

Common options:

- **-c**<RANGE> – output **c**hars in RANGE [example: **-c**3-4, 6, 9-]
 - **-f**<RANGE> – output **f**ields in RANGE [example: **-f**3-4, 6, 9-]
 - **-d**<C> – use character C as the field **d**elimiter [example: **-d**" "]
- Specify either **-c** or **-f**

Notes:

- Default field delimiter is tab ("**\t**")
- RANGE is specified with dashes "**-**" and commas "**,**"
- If no files are specified, then reads text from standard input

Cutting – examples

- Print the first 2 first names from `phone_dir.txt`

```
cut -f2 -d" " phone_dir.txt | head -n2
```

Andrew
Bruce

- Consider space character as delimiter

- Print the last 3 last names from `phone_dir.txt`

```
cut -f1 -d"," phone_dir.txt | tail -n3
```

NAKAMURA
REEVE
ROSNER

- Consider comma character as delimiter to separate last name from rest of the line

Pasting

The command **paste**: puts files side by side

Usage: **paste** [options] [files]

Common options:

- **-d<C>** – use character C as the field **d**elimiter [example: **-d" "**]

Notes:

- Default field delimiter is tab ("**\t**")

Pasting – examples

- The file `zipcodes` contains 5-digit zipcodes
- **Task I:** Paste the content of `phone_dir.txt` side by side with the content of `zipcodes`; separate these 2 tables with a tab. Then show just the first three lines

```
paste -d"\t" phone_dir.txt zipcodes | head -n3
```

ADAMS, Andrew 7583	34980
BARRETT, Bruce 6466	12567
BAYES, Ryan 6585	87492

Pasting – examples

- **Task II:** Multiply each line of data in `zipcodes`, by having the data on each line repeat itself 3 times (the repetitions should be separated by colons)

```
paste -d"::" zipcodes zipcodes zipcodes
```

```
34980:34980:34980  
12567:12567:12567  
87492:87492:87492  
...
```

Sorting

The command **sort** sorts lines of given file (or **stdin**) according to lexicographical (alphabetical) order

Usage: **sort** [**options**] [**files**]

Select command line options for **sort**:

- **-r** – reverse order
- **-n** – sort based on numerical order – e.g., 9 before 21
(lex. order puts 21 before 9)
- **-k<N>, <M>**
 - Sort based on a key defined using the string that starts in the *N*-th word and ends at the end of the *M*-th word
 - Default delimiter is any white space (space, tab, etc.)
 - You can use multiple keys to define a sequence of sorting priorities

Sorting

The command **sort** sorts lines of given file (or **stdin**) according to lexicographical (alphabetical) order

Usage: **sort** [options] [files]

Example:

cat file.txt

```
a 1001 3
d 1003 1
e 1004 2
b 1001 2
f 1001 1
c 1002 4
```

sort -k2,2 file.txt

```
a 1001 3
b 1001 2
f 1001 1
c 1002 4
d 1003 1
e 1004 2
```

Sorts based on 2nd field; ties are kept in original order

sort -k2 file.txt

```
f 1001 1
b 1001 2
a 1001 3
c 1002 4
d 1003 1
e 1004 2
```

Sorts based on 2nd-3rd fields combined

Sorting - Examples

Primary and secondary sorting keys: sort based on one key and within that based on another key

`cat fruits.txt`

```
apple  2 10
banana 1 20
cherry 2  5
date    1 10
fig     3  7
```

`sort -k2,2n fruits.txt`

```
banana 1 20
date    1 10
apple   2 10
cherry  2  5
fig     3  7
```

Sorts numerically based on 2nd field; ties are kept in original order

`sort -k2,3n fruits.txt`

```
banana 1 20
date    1 10
apple   2 10
cherry  2  5
fig     3  7
```

*Sorts based on 2nd and 3rd fields **combined** – combined means that 1 20 is treated as a single composite field (like a string) which is why banana is before date; ditto for apple/cherry*

`sort -k2,2n -k3,3n fruits.txt`

```
date    1 10
banana  1 20
cherry  2  5
apple   2 10
fig     3  7
```

*Sorts numerically based on **primary** key field2, then numerically based **secondary** key field3*

This is probably the intention

Sorting - Examples

Example – get first names and phone numbers, sort based on first name and within that based on phone number

```
cut -f2-3 -d" " phone_dir.txt | sort -k1,1 -k2,2n
```

Removing consecutive identical lines

The command **uniq** collapses identical **consecutive** lines in a file. Often used on sorted files.

```
cat repeat.txt
```

```
first line
first line
second line
first line
third line
```

```
uniq repeat.txt
```

```
first line
second line
first line
third line
```

```
sort repeat.txt | uniq
```

```
first line
second line
third line
```

The **-c** option for the command **uniq**: for each line of output, prepend it with the number of occurrences

```
uniq -c repeat.txt
```

```
2 first line
1 second line
1 first line
1 third line
```

```
sort repeat.txt | uniq -c
```

```
3 first line
1 second line
1 third line
```

File processing using pipes – examples

Task 1 – get unique set of first names:

File processing using pipes – examples

Task 1 – get unique set of first names:

- Step 1: cut second column

```
cut -f2 -d" " phone_dir.txt
```

- Step 2: sort

```
cut -f2 -d" " phone_dir.txt | sort
```

- Step 3: collapse duplicate lines (**uniq**)

```
cut -f2 -d" " phone_dir.txt | sort | uniq
```

```
Abe
Andrew
Bill
...
```

File processing using pipes – examples

Task II – number of people whose first name starts with each letter:

File processing using pipes – examples

Task II – number of people whose first name starts with each letter:

- Step 1-2: cut first character of second column

```
cut -f2 -d" " phone_dir.txt | cut -c1
```

- Step 3-4: sort and count unique lines

```
cut -f2 -d" " phone_dir.txt | cut -c1 | sort | uniq -c
```

cut first character

2 A

2 B

2 D

1 J

...

prepend with # of occurrences

File processing using pipes – examples

Task III – generate an incorrect phone directory, by concatenating each line of `phone_dir.txt` with a dash and an additional four digits. The four digits are taken from the third column of `phone_dir.txt`, sorted in decreasing numeric order. You may use one intermediate file.

File processing using pipes – examples

Task III – generate an incorrect phone directory, by concatenating each line of `phone_dir.txt` with a dash and an additional four digits. The four digits are taken from the third column of `phone_dir.txt`, sorted in decreasing numeric order. You may use one intermediate file.

File processing using pipes – examples

Task III – generate an incorrect phone directory, by concatenating each line of `phone_dir.txt` with a dash and an additional four digits. The four digits are taken from the third column of `phone_dir.txt`, sorted in decreasing numeric order. You may use one intermediate file.

- Step 1: cut 3rd column, sort and direct to `nums.txt`

```
cut -f3 -d" " phone_dir.txt | sort -rn > nums.txt
```

- Step 2: paste alongside `phone_dir.txt` (separated by dash)

```
paste -d"- " phone_dir.txt nums.txt
```

```
ADAMS, Andrew 7583-9749
BARRETT, Bruce 6466-7583
BAYES, Ryan 6585-7484
...
```

Lecture overview

- Text processing commands (`head`, `tail`, `wc`)
- Redirection
- Pipes
- Text delimited tables (`cut`, `paste`, `sort`)
- Simple character-based editing (`tr`) ←

Character substitution

- **tr** (translate) is used for simple character substitution

```
tr [options] set1 [set2]
```

- Input is read from standard input and written to standard output (**no files**)
- **tr** accepts two sets of characters (for simplicity: sets should be of equal length) and replaces each character in the first list with the corresponding one in the second list

```
tr "abc" "ABC" converts a → A , b → B , and c → C
```

For more complex substitution, use **sed** (next week)

tr – using ranges

- Sets may contain literal characters, such as "D", or character ranges, such as: "**a-j**" or "**DEFa-z**"
- Example – convert lower-case to upper-case:

```
tr "a-z" "A-Z"
```

tr – using ranges

- **tr** has some interpreted sequences to simplify the definition of sets:
 - **[:alpha:]** – all letters
 - **[:upper:]** – all uppercase letters
 - **[:lower:]** – all lowercase letters
 - **[:digit:]** – all digits
 - **[:alnum:]** – all letters and digits
 - **[:space:]** – all whitespace (e.g., the space, tab, and new line characters)
 - **[:punct:]** – all punctuation characters

tr – Examples

- `cat phone_dir.txt | tr [:upper:] [:lower:]`

```
adams, andrew 7583
barrett, bruce 6466
bayes, ryan 6585
...
```

- `cat phone_dir.txt | tr "[:upper:][:lower:]" "[:lower:][:upper:]"`

```
adams, aNDREW 7583
barrett, bRUCE 6466
bayes, rYAN 6585
...
```

- `echo "abcdefg" | tr "a" "A"`

```
Abcdefg
```

tr – options

- **tr -s** – **s**queeze consecutive repeats of a character

```
==> echo 'AB*****CD' | tr -s "*"
AB*CD
```

```
==> echo 'AB    CD    EF' | tr -s "[:space:]"
AB CD EF
```

```
==> echo 'ABCDEF' | tr -s " "
ABCDEF
```

tr – options

- `cat phone_dir.txt | tr -s "ENFRST"`

ADAMS, Andrew 7583

BARET, Bruce 6466

BAYES, Ryan 6585

BECK, Bill 6346

BENET, Peter 7456

DAVIS, John 3456

ESA, Konrad 3549

GRAHAM, Linda 6141

HARMER, Peter 7484

LINCOLN, Abe 9749

MAKORTOF, Peter 9328

MEASDAY, David 6494

NAKAMURA, Satoshi 6453

REVE, Shirley 7391

ROSNER, David 6830

tr – options

- **tr -d** – delete characters (i.e., translate to nothing)

```
==> echo 'AABabCD' | tr -d "Ab"  
BaCD
```

```
==> echo 'AABabCD' | tr -d [:upper:]  
ab
```

File processing using pipes – example

Go over the story *A Tale of Two Cities* and print the ten most frequent words in the file, with their number of appearances

Question: how do you define a word?

One possible answer: a string of non-white-space characters between two white space characters

<code>cat a-tale-of-two-cities.txt \</code>	(print file)
<code>tr [:space:] "\n" tr -s "\n" \</code>	(put words in separate lines)
<code>sort \</code>	(sort words)
<code>uniq -c \</code>	(count words – after sorting)
<code>sort -k1,1nr \</code>	(sort based on counts)
<code>head</code>	

File processing using pipes – example

Go over the story *A Tale of Two Cities* and print the ten most frequent words in the file, with their number of appearances

<code>cat a-tale-of-two-cities.txt \</code>	(print file)
<code>tr [:space:] "\n" tr -s "\n" \</code>	(put words in separate lines)
<code>sort \</code>	(sort words)
<code>uniq -c \</code>	(count words – after sorting)
<code>sort -k1,1nr \</code>	(sort based on counts)
<code>head</code>	

Follow-up issues (to be discussed in recitation):

- Why is the “empty word” counted and how can we remove it?
- What about case-sensitivity?
- What to do with punctuation marks and digits: delete; or use as word separators?

Text parsing in Linux – recap

- Text is the standard interface in Linux
- This naturally seems inconvenient for us now that we are used to more intuitive interfaces involving graphics and touch
- However, text interface is extremely powerful, because it allows all Linux commands to easily “interact” with one another in solving complex tasks
- We saw how this approach can be used to write simple “one line programs” to solve relatively complex tasks
- Next lecture we’ll see how regular expressions can be used to provide even more power to this set of tools

At home...

- Homework exercise #1 due **Sunday, April 5 @ 21:00**
- Read submission instructions carefully before preparing for submission
 - How to submit in pairs? (PARTNER file)
 - How to check solution? (check_ex script)
 - How to submit solution (submit_ex script)
- In lectures 1 and 2, we discussed many commands/options. See cheatsheet on Piazza, in Resources section: *Sysprog-guide-linux-commands-summary-lectures-1and2.pdf*
 - For you to self-teach: `tr -c`
- Optional: read `vi` tutorial (contains practice exercises – not for submission).
- Homework exercise #2 will be published on Thursday, due **Sunday, April 12 @ 21:00**
